

Introduction to Sustainability evaluations

Toolbox

Prof. J. Dewulf
Ghent University
Belgium

1. Introduction

Where do we come from?

Ghent University

Faculty of Bioscience Engineering

Department of Green Chemistry and Technology

Sustainable Systems Engineering Group

Sustainability Systems Engineering group:

2. Sustainability Assessment toolbox

(Environmental) sustainability: increasingly a hot topic

The Sustainability Assessment Toolbox today:

Different concepts as a base for sustainable management:

Different concepts/frameworks:

- They cover different aspects
- They partially overlap
- Need for a consistent base
- Anthropogenic focus

- Key input:
data
- Key advantage:
avoiding burden shifting (type of impact, place, time ...)

Life cycle thinking:

Life cycle assessment (LCA):

EC Communication on Integrated Product Policy (COM (2003) 302):

“Life Cycle Assessments provide the best framework for assessing the potential environmental impacts of products currently available”

Policy level:

**European Platform for LCA
(EPLCA)**

What are Critical Raw Materials?

Economic importance

- Importance of a raw material per economic sector & importance of the sector in the EU economy

Supply risk

- Political and economic stability
- Level of production concentration
- Potential for substitution
- Recycling rate

EU 2014 :

Social Life Cycle Analysis

Social Impact: Quantifiable?

Social Assessment: UNEP SETAC framework based on 'who affected':

Stakeholder categories	Impact categories	
	midpoint	endpoint
Workers/employees	Freedom of association and collective bargaining, child labour, fair salary, working hours, forced labour, equal opportunities/discrimination, health and safety, social benefits/social security	Human rights Working conditions Health and safety Cultural heritage Governance Socio-economic repercussions
Consumer	Health and safety, feedback mechanism, consumer privacy, transparency, end of life responsibility	
Society (national and global)	Public commitments to sustainability issues, contribution to economic development, prevention and mitigation of armed conflicts, technology development, corruption	
Local Community	Access to material and immaterial resources, delocalization and migration, cultural heritage, safe & healthy living conditions, respect of indigenous rights, community engagement, local employment, secure living conditions	
Value chain actors	Fair competition, promoting social responsibility, supplier relationships, respects of IP rights	

Social Assessment:

How to quantify impacts?

Two possibilities:

- How many children are working in the production chain?

Difficulties:

- How to get the data
 - How to compare with other indicators (e.g. risk)
- Semi-quantification:

The Likert scale – on a scale from 1 to 5 how many children work in the production chain?

Very few, few, average, rather many, a lot

Social Assessment:

Alternative approach: flagging

A life cycle concerns a lot of processes:

Solution = flagging

Per phase of the life cycle (resource extraction, production, use and end-of-life) identify 3 hotspots per indicator

Data from:

- Surveys
- Literature
- Databases: e.g. social hotspots database
- Expert judgement

First SLCA software: Social Hotspots DataBase (SHDB)

1. Choose Category: Labor Rights & Decent Work
2. Choose Theme: Child Labor
3. Choose Issue: Risk of Child Labor

Risk Levels
World View

Country Search:

Legend: No Evidence, Low, Medium, High, Very High, Not Applicable, No Data

Second SLCA software: PSILCA (Open LCA)

Social indicators

Stakeholder	Subcategory	Indicator
WORKERS	Child labour	Children in employment, male Children in employment, female Children in employment, total
	Forced Labour	Goods produced by forced labour Frequency of forced labour Trafficking in persons
	Fair Salary	Living wage, per month Minimum wage, per month Sector average wage, per month
	Working time	Weekly hours of work
	Discrimination	Gender wage gap
	Health and Safety	Rate of non-fatal accidents Rate of fatal accidents DALYs due to indoor air pollution Presence of sufficient safety equipment Workers affected by occupational health and safety issues
	Social benefits, legal issues	Social security expenditure Evidence of violations of labour laws
	Freedom of association and collective bargaining	Trade union density Right of Association Right of Collective Bargaining Right to Strike
	Fair competition	Presence of anti-competitive practices
	Corruption	Public sector corruption Active involvement in anti-corruption measures
VALUE CHAIN ACTORS	Promoting social responsibility	Membership in an initiative that promotes social responsibility along the supply chain

- ▣ Social indicators
 - ▣ Local Community
 - ▢ Access to material resources
 - ▢ Local Employment
 - ▣ Migration
 - 👤 International Migrant Stock
 - 👤 International migrant workers in the sector
 - 👤 Net migration rate
 - ▢ Respect of indigenous rights
 - ▢ Safe and healthy living conditions
 - ▣ Society
 - ▢ Value Chain Actors
 - ▣ Workers
 - ▢ Child labour
 - ▢ Discrimination
 - ▣ Fair Salary
 - 👤 Living wage, per month
 - 👤 Minimum wage, per month
 - 👤 Sector average wage, per month
 - ▢ Forced Labour
 - ▢ Freedom of association and collective bargaining
 - ▢ Health and Safety (Workers)
 - ▢ Social benefits, legal issues
 - ▢ Working time

legislation

Social LCA development

- Far less mature than environmental LCA
- First databases available
- Constructed:
 - Sector specific
 - Country specific
- Based on semi-quantitative indicators

Basis: World Economic Input/Output models:

	PSILCA	SHDB
Input/output model	Eora Multi-regional input/output database (2012)	Model of the Global trade analysis project (GTAP)
Number of countries covered	189	113
Number of industry sectors	14,838 (commodities + sectors)	57

3. New challenges beyond Brundtland

Biomass

-Solar energy → photosynthesis → plants = biomass

-Photosynthetically active radiation = PAR =
spectral range 400 to 700 nanometer that can be
used by plants

Unconventional fossils: shale gas

U.S. Natural Gas Production 1990-2035

trillion cubic feet per year

Source: U.S. Energy Information Administration, *Annual Energy Outlook 2012* (June 2012).

(In)efficiencies

“Major opportunities to provide more services to the community with lower carbon footprint is not to be situated in alternative resources but rather in improved resource utilization efficiency”

Jos Delbeke, EU DG ENVIRONMENT
Keynote lecture at “Innovation for Sustainable Production”
Bruges 18–21 April (2010).

Mineral resources

Fight for natural resources:

Mobile phone

Laptop

Electrical cars

Storage of (solar) energy/electricity

...

Cobalt example:

- Co for batteries: 700 t in 1995 to 12000 t in 2005
- 2007: 25% of global Cobalt market to batteries

China's "deal of the Century" to save Congo?

EU project:
RePair

Ivago maakt stoom van afval

Spectaculaire werkzaamheden gisterochtend bij de verbrandingsoven van de intercommunale Iva-go in de Proeftuinstraat in Gent. Er worden volop stoomketels geïnstalleerd. Daardoor gaat de warmte van de verbrandingsoven niet meer verloren, maar wordt ze omgezet in stoom en elektriciteit. De gigantische onderdelen van de oven wegen elk ruim 50 ton. Ze worden als een meccano in elkaar gezet met een reuzenkraan. Via een twee kilometer lange pijplijn gaat de stoom naar het Universitair Ziekenhuis, dat er zijn gebouwen mee zal verwarmen. Normaal gezien moet de vernieuwde oven af zijn tegen het najaar. © Gianni Barbieux

**From concepts in the 1990s to
implementation into policy:**

**EU “Circular Economy Package”
Dec 2015**

4. Life Cycle Assessment

Basis:

Impact assessment modeling based on cause and effect chain

At endpoint level: example for Climate Change:

Elementary flows

Areas of Protection (AoP)

Life Cycle Assessment

assessing impacts on 3 endpoints:

- Ecosystem health
- Human health
- Natural Resources (↔ resource depletion)

- Highly debated subject: science/policy makers/industry

- Problems with implementation in LCA (PEF pilots, 2013-2018):

LCA: “the compilation and evaluation of the inputs, outputs and the potential environmental impacts of a product system (good or service) throughout its life cycle, from the extraction of raw material to product disposal”

International Organization for
Standardization:

guidelines for LCA

- 4 major steps
- iterative

Direct applications:

- Product development and improvement
- Strategic planning
- Public policy making
- Marketing
- Other

Step 1: Goal and scope definition

Goal:

1. Intended application / reason for the study
2. Audience of the study

Example of timber

Life cycle of timber

Goal:

1. What is the impact of timber compared to concrete as a construction material?
Which step of its life cycle has the highest impact?
2. Audience of the study: general public or building company

Scope:

1. Choice of functional unit (FU):

Amount of the studied good(s) and/or service(s)
+ *How long? Which quality?*

Example: plastic vs. paper bag for shopping:
volume? carrying capacity? lifetime, re-usable?

- fair comparison needed
- service: carrying 10 kg of identical goods

Scope:

2. Choice of system boundaries

Scope:

2. Choice of system boundaries:

Time and money needed for data collection

Cut-off criteria

e.g. >1% of mass input

2. Choice of system boundaries

Subdivide system into:

1. **Foreground system:**

- core processes under direct control or decisive influence
- specific/primary data

2. **Background system:**

- auxiliary processes
- generic/secondary data

Step 2: Life cycle inventory analysis

Data collection about input and output flows of the system

Most time consuming step

Elementary flows to and from the natural environment:

Besides emissions (elementary flows), other output flows:

(co)products

OR

wastes

“substances or objects which the holder intends or is required to dispose of” (ISO, 2006)

environmental impact
attributed to (co)products

no environmental impact
attributed to wastes

Difficult distinction, time-dependent

Example of sawn timber:

Sawn timber: main product / Saw dust: waste or coproduct?

Saw dust as waste: no environmental impact

Saw dust as coproduct: how to divide environmental impact
between sawn timber and saw dust?

Multifunctionality issue:

A system or process produces more than one product

How to assign the inventory flows
and the associated environmental impacts
to two or more products?

ISO guidelines (2006)

Step 3: Life cycle impact assessment

Data inventory: elementary flows (natural resource use and emissions)

Environmental impact assessment

1. Classification
2. Characterization
3. Valuation (optional)

Classification of elementary flows into impact categories

Examples:

Impact categories
Global warming
Stratospheric ozone depletion
Photochemical smog formation
Human carcinogenicity
Atmospheric acidification
Aquatic toxicity
Terrestrial toxicity
Habitat destruction
Depletion of nonrenewable resources
Eutrophication

Characterization: quantification of the potency of the env. effect

Example Climate Change impact:

Life Cycle Inventory Value	*	GWP Factor	=	Impact Potential
25 kg CO ₂	*	1	=	25 [kg CO ₂ -equivalent]
2 kg CH ₄	*	25	=	50 [kg CO ₂ -equivalent]
...	*	...	=	...
Total:				75 [kg CO ₂ -equivalent]

1 kg of CH₄ emission is equivalent to 25 kg CO₂ of emission

GWP: global warming potential

Characterization at midpoint or endpoint level

At endpoint level: example for Climate Change

Elementary flows

Areas of Protection (AoP)

Characterization at midpoint or endpoint level

At endpoint level:

- At the end of the cause-effect chain
- Better comprehensible to broad audience
- Higher uncertainty (compared to midpoint)

Damage to the Areas of Protection (AoPs):

HUMAN HEALTH

NATURAL RESOURCES

ECOSYSTEMS

Midpoint indicators linked to endpoint indicators

IMPACT CATEGORIES

DAMAGE TO AOPs

Step 4: Interpretation

- Interpret results of the impact assessment
 - Answer research questions defined in the goal
 - **One product:** identify hot spots in the life cycle
 - **Two or more products:** recommend about product with lowest environmental impact
- ! Take into account limitations, choices and assumptions

Uses of life cycle studies

1) Product comparison

VS.

VS.

Plastic vs. fuel: Which use of the Brazilian ethanol can bring more environmental gains?

Rodrigo A.F. Alvarenga, Jo Dewulf*

Is it better to remove pharmaceuticals in decentralized or conventional wastewater treatment plants? A life cycle assessment comparison

Elorri Igos, Enrico Benetto*, Silvia Venditti, Christian Kohler, Alex Cornelissen, Ruth Moeller, Arno Biwer

Uses of life cycle studies

2) Product design and improvement

- identify processes, ingredients, and systems that are **major contributors** to environmental impacts
- compare **different options** within a particular process with the objective of minimizing environmental impacts

Eco-design

ISO: “a process **integrated within product design and development** that aims to reduce environmental impacts and continually to improve the environmental performance of the products, throughout their life cycle”

5. Key challenge in LCA: Resources

Insights from a thermodynamic approach

What basis to be chosen for integrated resource mgt?

Prof. Whitesides (Harvard)
at Green Chem. Conf. (Washington, 2005):

*Sustainable technology development:
If emissions are a bit under control:*

- *Economically sound*
- *Thermodynamically sound*

Idea: take thermodynamics as a base for resource management that enables:

- Overall resource input assessment
- Overall resource efficiency assessment

First law and Second law ...

Explaining second law through the exergy concept

What if our world were an infinite hazy desert?
The sand and air are warm, an ocean of energy –
energy everywhere. But if you try to use it, it
doesn't work. A landscape of uniformity, nothing
concentrated, nothing unique.

(W. Hermann, Stanford, 2007)

Energy can be used and
work performed when a
substance that is different
from its surroundings is
allowed to equilibrate

Resources

are energy and matter that
exist out of equilibrium with
the environment

exergy

is a measure of work potential or
disequilibrium from the environment

While

exergy can be destroyed, **energy** cannot

exergy is the useful portion of **energy**

exergy

is what most mean when they say

energy

Assess the thermodynamic efficiency: exergy analysis

Economic sustainability and Environmental sustainability

Calculation of exergy: matter flow - chemical exergy

Final state in physical exergy calculation

= initial state in chemical exergy calculation

*Chemical exergy is equal to the **maximum** amount of work obtainable when the substance under consideration is brought **from the environmental state to the dead state** through chemical reactions and exchange of compounds.*

Calculation of exergy: matter flow - chemical exergy

Final state in physical exergy calculation

= initial state in chemical exergy calculation

*Chemical exergy is equal to the **maximum** amount of work obtainable when the substance under consideration is brought **from the environmental state to the dead state** through chemical reactions and exchange of compounds.*

*Chemical exergy is equal to the **minimum** amount of work necessary to **synthesise**, and to deliver in the environmental state, the substance under consideration **from reference substances (in dead state)** by means of processes involving heat transfer and exchange of substances only with the environment.*

Calculation of exergy: chemical exergy

Homogenous reference environment

- Atmosphere
- Sea (dissolved ions)
- Earth's crust

Composition → Reference substances

- Abundant and most probable in the environment
- Low chemical potential
- Chemically stable
- In equilibrium with the rest of the environment
- Present in aggregation state (solid, liquid or gas) at which they would normally occur at T_0 and P_0
- Present at average natural world concentration

Calculation of exergy: chemical exergy

By definition: a reference substance at reference concentration (or partial pressure for a gas) and reference aggregation state $\rightarrow Ex = 0$

e.g. CO_2 (g) at P_{00} (0.03 kPa)

Following aspects should be taken into account when quantifying chemical exergy:

- Chemical formula
- Aggregation phase (solid, liquid or gas)
- Concentration (solid, liquid) or partial pressure (gas)
- Crystal structure (solid)

Calculation of exergy: chemical exergy

Non-reference substances

Transformed into reference substances (at standard conditions)

Example: methane $\text{CH}_4 + 2 \text{O}_2 \rightarrow \text{CO}_2 + 2 \text{H}_2\text{O}$

Maximum amount of work obtainable out of a reversible reaction:

$$\begin{aligned}\Delta G_r^0 &= \sum G_{products}^0 - \sum G_{reactants}^0 \\ &= \sum H_{products}^0 - \sum H_{reactants}^0 - T_0(\sum S_{products}^0 - \sum S_{reactants}^0) \\ &= \sum Ex_{ch,products}^0 - \sum Ex_{ch,reactants}^0\end{aligned}$$

Exergy of non-reference substance is found if exergy values of other compounds are known

Calculation of exergy: chemical exergy

Solid fuels	Liquid fuels
Solid hydrocarbon $\beta = 1.0435 + 0.0159 \frac{H}{C}$	Liquid hydrocarbon $\beta = 1.0406 + 0.0144 \frac{H}{C}$
Solid C, H, O compounds $\beta = 1.0438 + 0.0158 \frac{H}{C} + 0.0813 \frac{O}{C} \quad \left[\frac{O}{C} \leq 0.5 \right]$ $\beta = \frac{1.0414 + 0.0177 \frac{H}{C} - 0.3328 \frac{O}{C} \left[1 + 0.0537 \frac{H}{C} \leq 0.5 \right]}{1 - 0.4021 \frac{O}{C}} \quad \left[\frac{O}{C} \leq 2 \right]$	Liquid C, H, O compounds $\beta = 1.0374 + 0.0159 \frac{H}{C} + 0.0567 \frac{O}{C} \quad \left[\frac{O}{C} \leq 1 \right]$
Solid C, H, O, N compounds $\beta = 1.0437 + 0.014 \frac{H}{C} + 0.0968 \frac{O}{C} + 0.0467 \frac{N}{C} \quad \left[\frac{O}{C} \leq 0.5 \right]$ $\beta = \frac{1.044 + 0.016 \frac{H}{C} - 0.3493 \frac{O}{C} \left[1 + 0.0531 \frac{H}{C} \right] + 0.0493 \frac{N}{C}}{1 - 0.4124 \frac{O}{C}} \quad \left[\frac{O}{C} \leq 2 \right]$	Liquid C, H, O, S compounds $\beta = 1.0407 + 0.0154 \frac{H}{C} + 0.0562 \frac{O}{C} + 0.5904 \frac{S}{C} \left(10.175 \frac{H}{C} \right) \quad \left[\frac{O}{C} \leq 1 \right]$
Bituminous coal, lignite, coke, peat $\beta = 1.0437 + 0.1896 \frac{Z_{H2}}{Z_c} + 0.0617 \frac{Z_{O2}}{Z_c} + 0.0428 \frac{Z_{N2}}{Z_c} \quad \left[\frac{Z_{O2}}{Z_c} \leq 0.667 \right]$	Liquid technical fuels $\beta = 1.0401 + 0.01728 \frac{Z_{H2}}{Z_c} + 0.0432 \frac{Z_{O2}}{Z_c} + 0.5904 \frac{Z_s}{Z_c} \left(1 - 2.0628 \frac{Z_{H2}}{Z_c} \right)$
Wood $\beta = \frac{1.0412 + 0.216 \frac{Z_{H2}}{Z_c} - 0.2499 \frac{Z_{O2}}{Z_c} \left[1 + 0.7884 \frac{Z_{H2}}{Z_c} \right] + 0.045 \frac{Z_{N2}}{Z_c}}{1 - 0.3035 \frac{Z_{H2}}{Z_c}} \quad \left[\frac{Z_{O2}}{Z_c} \leq 2.67 \right]$	

Environmental sustainability assessment of food waste valorization options

T. Vandermeersch^{a,b}, R.A.F. Alvarenga^a, P. Ragaert^b, J. Dewulf^{a,*}

Scenario 1

Scenario 2

Resource management: from process to life cycle level

Methods were developed to calculate natural resource “footprints”

Methods were developed to calculate natural resource “footprints”

Cumulative Exergy Extraction of the Natural Environment

(Dewulf et al., 2007)

6. Illustrative cases

SUBSTANTIATING ENVIRONMENTAL SUSTAINABILITY CLAIMS

Case :

Are supercritical solvents green?

Green Chemistry Principle 5:

The use of auxiliary substances (e.g., solvents, separation agents, etc.) should be made unnecessary wherever possible and innocuous when used.

(Anastas & Warner)

Supercritical CO₂ as a Solvent

Case at Janssen Pharmaceutica (J&J):

Substitute classical solvent separation
by using supercritical CO₂:

Is this more environmental sustainable from a resource
point of view?

- at process level : α
- at plant level: β
- at overall supply chain: γ

(Van der Vorst et al., Green Chem., 2010)

Environmental Sustainability Assessment of Algae Production Systems

Methodological development and case studies

Ir. Sue Ellen Taelman

Public PhD defense - 12/05/2016

Promotors

Prof. Dr. Ir. Jo Dewulf

Prof. Dr. Ir. Steven De Meester

- Potential applications of algae

Energy

Pollution treatment

Feed

Food

**Chemical
industry**

Fertilizer

**Pharmaceutical
industry**

**Cosmetic
industry**

- Feed sector is extremely interested

Meat and fishery production, dressed weight or eviscerated basis

Million tonnes

Notes: Total fishery production = capture + aquaculture. Beef and pork on a dressed-weight basis; poultry and fish on an eviscerated basis.

Sources: OECD and FAO Secretariats.

- High amounts of proteins used in EU for animal feeding: 26 million tonnes annually

EU self-sufficiency:

3%

LANDSCAPES AT RISK FROM SOY EXPANSION

**Deforestation &
loss of valuable ecosystems
Water & soil pollution**

Sources of proteins used for animal feeding in the EU (2012/2013), in % of total protein use (both import and EU-production) (FEFAC)

- **Challenge:** increase feed production while reducing the ecological footprint worldwide (import ↓)
- **Solution?** Farming for protein self-sufficiency in Europe but avoid competition for fertile land

Algae? Main driving forces...

→ High protein content found in several algal species

	Proteins (% DM)	Carbohydrates (% DM)	Lipids (% DM)
<i>Scenedesmus obliquus</i>	50-56	10-17	12-14
<i>Chlorella vulgaris</i>	51-58	12-17	14-22
<i>Dunaliella salina</i>	57	32	6
<i>Tetraselmis maculata</i>	52	15	3
<i>Spirulina platensis</i>	46-63	8-14	4-9
<i>Spirulina maxima</i>	60-71	13-16	6-7
Soybeans	42	20	33

Encarnación et al., 2010
Keshun (1997)

→ Shift to unproductive land or oceans

- A few cultivation systems tested in Europe

Photobioreactors (PBRs)

Open ponds

Coastal regions

- Several LCIA methods are developed during recent years focusing on emissions to the environment (e.g., IPCC 2007)
- However, resource efficiency is a major challenge in our everyday life, but only few LCIA methods account for resource consumption

E.g., CEENE method (*Dewulf et al. 2007*)

All resources expressed in exergy

→ *not only the quantity but also the quality of a resource can be assessed*

Sum of all natural resources consumed = environmental resource footprint

Advantage algae cultivation: usage of waste streams

-> Integrated algal biorefinery in The Netherlands (Lelystad)

Figure 7 Process flow scheme microalgae production chain (pilot 2012, scale 240 m²). Data inventory per MJ_{ex} dry matter algal biomass. Overall there are five distinct subprocesses within the foreground system (indicated by the red dotted line): nutrient mixing (process A), cultivation *Nannochloropsis* sp. (process B), membrane separation (process C), centrifugation (process D), freeze drying (process E).

Data from Prudêncio da Silva et al.

Comparison with a relevant protein alternative :

A linear economy

Soybean production in brazil

→ soil depletion

Livestock production in EU

→ manure treatment

CEENE results

Focus on:

1 MJ_{ex} meal

0.5 MJ_{ex} oil

MJ _{ex} /functionalities	TOTAL	Relative contribution (%)
LINEAR ECONOMY		
Soybean cultivation	5.15	91.47
Drying	0.18	3.19
Crushing	0.10	1.75
Export to The Netherlands	0.20	3.58
TOTAL	5.63	
BIOREFINERY		
Algae cultivation	622	99.53
Drying	2.82	0.45
Crushing	0.13	0.02
TOTAL	625	

> factor 100 difference could be expected:
mature large scale technology (soybean) versus young small scale technology (algae)

Future outlook?

Possible to achieve a lower footprint? Let's have a look...

- Electricity based on renewables (wind energy)
- Reducing operating hours of blowing and mixing
- More efficient ventilators (not oversized)
- Higher yields under current climate possible
- Higher harvesting efficiency possible

Total resource footprint (CEENE) drops with factor 20!

**When abiotic renewables are considered inexhaustible
-> similar footprint!**

Even other possibilities:

Recycling of centrate

Use of digestate
